

On the recover.php page:

Once you fill in your username and click recover you get:

However the recover button just recovers the account again, I think after you recover your account this button should be change to login and take you to: login.php

On my account page:

If I try to change my username to one that already exists it displays a message correctly:

my account

This username is already taken.

change username

However, if I try to change my email address to an email address that already exists it still allows me to put the duplicate email. It seems there is not the same check going on as with the username, can you please make the same:

my account

Email updated successfully.

summary

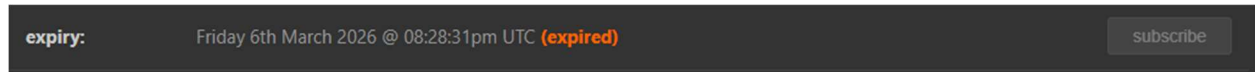

username:	dcook	change
email:	d*****@g****.com	change

On the my account page for 2FA:

two factor:	please allow 5 mins once enabled	enable 2fa
--------------------	----------------------------------	---

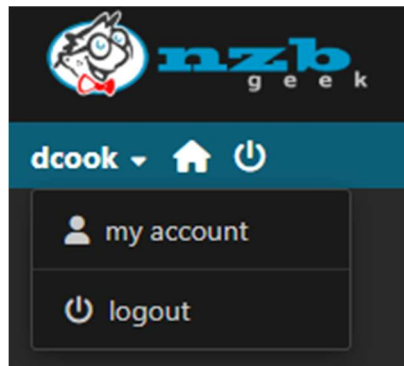

Do you know if there is a opensource way to do 2FA? I don't know much about how it all works, but I would like to have it as an option if feasible.

On the my-account page:

The subscribe button should take you to subscribe.php and it can be exactly like dashboard.php (I will change the content of this page later)

Also, on the drop down menu at the top:

Add subscribe as an option under my account, and have it goto the same subscribe.php page

On the Login and Register Pages can you add Cloudflare Turnstile (CAPTCHA)

<https://developers.cloudflare.com/turnstile/get-started/server-side-validation/>

I think you just need to add their code:

<https://developers.cloudflare.com/turnstile/get-started/client-side-rendering/#1-add-the-turnstile-script>

And then use the site key: 0x4AAAAAACoj7vxWbMp5RQp_

And secret key: 0x4AAAAAACoj7rTdsJNdaWZtGb8_DJ2dbwE

When users register, I would like to capture their ip address in the database, it can be called register_ip, once they are registered this value would not change, as its only captured during initial registration.

And then I would like another field that would show the ip address of their last login, this value would show the ip address of the last login. It can be called last_ip

We should also capture the date/time stamp of last login, that field can be called lastlogin_at
